Access to feedback in asynchronous seminars

PUBLIC SYNTHETIC MANUSCRIPT. All data, events and participants are invented for behavioral testing. This excerpt is not evidence about an actual course.

Abstract

Survey responses from 52 students showed that feedback was useful. Interviews added an account of how students used it. The study connects reported value with the timing and accessibility of feedback, rather than assuming that a favorable rating implies an opportunity to act.

Methods and results

The survey contained 48 completed responses from two seminar groups. It was anonymous and collected no identifier that could link a response to a later interview. Thirty-one respondents rated the feedback useful. Students were not assigned to different feedback conditions, and no test of learning gains was collected.

Seminar group	Completed responses
A	24
B	24
Total	48

Table 1. Complete survey responses. The denominator for the usefulness rating is 48.

Eight students volunteered for later interviews. Whether these students had answered the survey, and which response each might have given, could not be determined. Six described receiving useful comments too close to the next submission deadline to revise their work. Two described using comments to plan a later assignment. These accounts concern reported opportunities and uses, not observed changes in attainment.

All interviewees belonged to the favorable-rating subgroup. Their accounts validate the statistical mechanism by which useful feedback improved achievement.

批注 [AI1]: [Definite error | Major | C1] The abstract reports 52 students; Methods and Table 1 report 48 completed responses (24 + 24), with 48 as the usefulness denominator. This establishes an internal inconsistency, not which count is correct. Reconcile the counts against the study records, distinguishing any different populations or exclusions. Also describe the finding as 31 respondents rating the feedback useful; the excerpt provides no measured learning gains to support a broader benefit claim.

批注 [AI2]: [Needs verification | Minor | C2] The excerpt does not provide the usefulness item, response options, or positive-rating rule. These details are needed to interpret the 31 favorable responses and relate perceived usefulness to interview accounts. Report them in the full Methods or instrument appendix, including treatment of any missing item responses. Their absence here does not establish that measurement procedures were omitted.

批注 [AI3]: [Needs verification | Major | C3] The interview prompts/timing, analytic approach, and supporting excerpts are not supplied, so the grounding of the six timing accounts and two later-use accounts cannot be assessed. In the full paper, provide these details and contextualized case evidence; clarify whether the two descriptions overlap and how exceptions were considered. This is an evidence gap in the excerpt, not a finding that analysis was not done.

批注 [AI4]: [Definite error | Major | C4] This contradicts the preceding interview paragraph: even survey participation could not be determined, and the survey collected no linkage identifier. The Discussion also correctly says favorable respondents cannot be matched to timing accounts. Under the stated design, subgroup membership cannot be established. Align this sentence with that lack of linkage and integrate the survey pattern with interview accounts at the group or conceptual level.

批注 [AI5]: [Definite error | Major | C5] Methods states that no learning-gain test was collected, and the interview paragraph limits its evidence to reported opportunities and uses. No statistical mechanism analysis is reported. These accounts cannot establish improved achievement or validate that mechanism. Instead, integrate favorable survey ratings with interview accounts of timing constraints and later use. The Discussion already makes this defensible distinction; its concrete scheduling recommendation can stand. See C4 for the separate linkage contradiction.

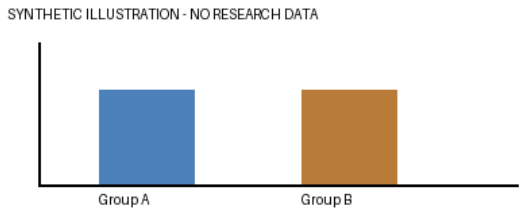

Figure 1. Equal bar heights represent the two survey group sizes, not measured learning outcomes.

Discussion

The analysis distinguishes perceived value from an opportunity to act on feedback. A comment can be regarded as useful yet arrive too late for the next task. The separate samples do not show which favorable survey respondents experienced a timing constraint.

批注 **[OA6]:** Original author comment: retain this distinction and check its wording with the coauthor.

Course teams should schedule feedback early enough for students to use it before the next assessed task. This recommendation connects the reported timing problem to a concrete teaching decision; it is not a claim that changing the schedule has already improved learning.

Working terminology retained in tracked changes: opportunity to use feedback

删除了: feedback effectiveness

The supplied material is a methods/results/discussion excerpt. No raw survey data, interview transcripts, literature section or journal template is supplied.
